

## amendo

Amendo is OneVision's new automated image enhancement solution. Significantly reduce image processing time, automatically adjust color, tone and size of images to improve image quality, and reduce your time to press by eliminating labor and time intensive manual image correction.

With its simple user interface and easy installation, no specialized training is required. The database driven browser based front end allows comprehensive monitoring, control and process automation. Visualize, automate and change processes in the prepress workflow to allow smart connection and interaction between multiple operators by providing seamless file logistics and management.

Manage, fix and enhance your files ... easily ... perfectly ... with OneVision solutions.

### ONEVISION'S IMAGE ENHANCER

#### AUTOMATED IMAGE ENHANCEMENT WITH COMPREHENSIVE FILE LOGISTICS

- Intelligent automatic image enhancement by individually processing different areas of the image
- Intuitive interactive image editor
- Significant reduction of image processing time while improving quality
- Easy to use interface, no need for specialized training
- Browser based Intranet access for process monitoring

## IMPROVE TIME TO MARKET

Printers and publishers require software that will automate every step of their prepress operations. When it comes to image processing, high quality is key. Whether your organization receives 40 images per day or 4,000, optimizing every photo before it appears in print is vital – especially now as photos can be provided by just about anyone with a digital camera. Rather than manually adjust each image by hand, an automated photo optimization engine is required in today's modern publishing environment.

## INCREASED PRODUCTIVITY THROUGH AUTOMATED IMAGE ENHANCEMENT

Think about it: Photos taken in extremely bright or low-light conditions lack contrasts – so natural colors such as vegetation, sky or even human skin tones don't look right. Backgrounds are often too dark, flash photos are typically overexposed ... these images should be automatically corrected and accessible in the prepress workflow. To increase productivity, a comprehensive, automated workflow is crucial.

OneVision's new Amendo software solution processes and improves all images automatically. The intelligent image enhancement solution works on individual parts of the image separately – not simply the image as a whole. Brightness and contrasts, shadows and highlights – as well as colors – are enhanced. Sharpness is improved. What's more, the software analyzes color values of numerous common elements such as vegetation, sky and skin and modifies the colors according to the human viewing patterns. And automatic resizing, color management, red eye removal and auto-rotation functions save production managers time.

Need to know what adjustments were made? All image enhancements can be easily identified on-screen via the software's quick and intuitive before-and-after comparison, which reduces the time needed for manual approval processes.

## INTERACTIVE IMAGE ENHANCEMENT

If additional manual intervention is desired, the images can be easily exported to third-party applications or enhanced directly using OneVision's solution. No matter whether the adjustment involves the color, color saturation, contrast such as shadows and highlights, brightness, sharpening, scaling, manual cropping or rotation, OneVision's image enhancing solution offers an array of interactive options for image optimization.

## SEAMLESS FILE LOGISTICS – FROM MOBILE DEVICE TO PRESS OR STORAGE

The browser based front-end allows comprehensive monitoring, control and process automation. It also gives full feedback to the user with information such as image history – who did what and when –, optional thumbnails, before-and-after previews and statistical data to show system performance and workflow peaks and troughs.
